Background

Calreticulin is a highly conserved chaperone protein which resides primarily in the endoplasmic reticulum, and is involved in a variety of cellular processes, among them, cell adhesion. Additionally, it functions in protein folding quality control and calcium homeostasis. Calreticulin is also found in the nucleus, suggesting that it may have a role in transcription regulation. Systemic lupus erythematosus is associated with increased autoantibody titers against calreticulin. Recurrent mutations in calreticulin have been linked to various neoplasms, including the myeloproliferative type.

Validation Data

Flow cytometry: 1X10⁶ knockout (KO) HeLa cells (negative control,left) and HeLa cells (right) were intracellularly-stained with ABflo[®] 488 Rabbit anti-Human Calreticulin mAb (A27387,5 µl/Test,orange line) or ABflo[®] 488 Rabbit IgG isotype control (A22069,5 µl/Test,blue line). Non-fluorescently stained cells were used as blank control (red line).
